SPIRIT LEVELING IN NEW YORK, 1896-1905 AND 1912-1916.

R. B. MARSHALL, Chief Geographer.

INTRODUCTION.

Cooperation.—The State of New York contributed financially to the work during the years 1896 to 1905 and from 1912 to 1916, inclusive, being represented by the office of the State engineer and surveyor.

Previous publication.—The following results of spirit leveling are supplemental to and accord with the elevations contained in Bulletin 514, and are in agreement with the 1912 adjustment of precise leveling. Descriptions and elevations of bench marks in Bulletin 281 are reprinted in this volume with corrections and additions.

Bulletin 514 and this bulletin together contain practically all results of leveling in New York State by the United States Geological Survey, the Coast and Geodetic Survey, the U. S. Lake Survey, the New York State Survey, the Board of Deep Waterways, and by the Corps of Engineers, United States Army. These elevations are likely to be changed but little by any future adjustment.

Corrections.—The following corrections to Bulletin 514 should be noted:

Pages 13-17, Lyon Mountain and Dannemora quadrangles: Connection made in 1912 with Coast and Geodetic Survey bench mark at Plattsburg necessitated a readjustment of elevations, and the corrected results are published in this volume.

Pages 17-18, Massena and Potsdam quadrangles: As a result of additional connections, circuits were readjusted in November, 1916, and corrected elevations are published in this volume.

Page 25, Beaver Falls, 3 miles west of, etc.: Permission to move bench mark granted April 21, 1915. Croghan, 70 feet south of railroad, etc.: Bench mark has been reset in new steps, but no record of its elevation has been received.

Page 30, Morris, in northwest side of main entrance to high school, etc.: Elevation should be 1,158.077 feet.

Page 33, insert "South" before New Berlin, for bench mark stamped "1059 ALBANY."

Page 34, Meridale, arch bridge over Ouleout Creek, etc.: Bench mark reset November 29, 1915, at elevation 1,801.740 feet.

Page 36, Parksville, 3.5 miles southeast of, etc.: Bench mark settled, new elevation 1,684.554 feet. Ferndale, 1.0 mile southeast of, etc.: Wall in which bench mark was set has been partly overthrown, elevation doubtful.

Pages 42-43, New York City datums. (See p. 121, this volume.)

Page 125, Risby Lakes should be "Bisby Lakes."

Personnel.—The field work from 1896 to 1906, inclusive, was done under the direction of H. M. Wilson, geographer, and the later work under Frank Sutton, geographer. The work since January, 1908, was done under the general direction of R. B. Marshall, chief geographer. Credit is given in the headings of the several lists to the respective levelmen. The office work in preparation of lists was done mainly by S. S. Gannett, geographer, under the general direction of E. M. Douglas, geographer.

Classification.—The elevations are classified as precise or primary, according to the methods employed in their determination. The former are determined by lines of levels run either in both forward and backward directions or by simultaneous double-rodged lines, a high-grade instrument being used and special precautions being taken in observations and reduction to correct errors and make the line continuously good throughout. The latter or primary levels are determined with the Y level, the levels being run mostly in circuits of single lines. The allowable limit of error observed on the precise work already done by the Geological Survey in this State is represented in feet by $0.03 \sqrt{D}$ and that for the primary work by $0.05 \sqrt{D}$, in which D is the length of circuit in miles.

Bench marks.—The standard bench marks are in two forms. The first form is a circular bronze or aluminum tablet (*C* and *E*, Pl. I), $3\frac{1}{2}$ inches in diameter and $\frac{1}{4}$ inch thick, having a 3-inch stem, which is cemented in a drill hole in solid rock in the wall of some public building, a bridge abutment, or other substantial masonry structure. The second form (*F*, Pl. I), used where masonry or rock is not available, consists of a hollow wrought-iron post $3\frac{1}{2}$ inches in outer diameter and 4 feet in length. It is split at the bottom and spread out to a width of 10 inches in order to give a firm bearing on the earth, and is set about 3 feet in the ground. A bronze or aluminum-bronze cap is riveted upon the top of the post. A third style of bench mark with abbreviated lettering (*B* and *D*, Pl. I), is used for unimportant points. This consists of a special copper nail $1\frac{1}{2}$ inches in length driven through a copper washer $\frac{7}{8}$ inch in diameter. The tablets as well as the caps on the iron posts are appropriately lettered, and cooperation by States is indicated by the addition of the State name (*G*, Pl. I). Another form used in 1896 and 1897 was a copper rod

4 inches long and 1 inch in diameter fastened into masonry or solid rock by driving it on a brass wedge placed in the bottom of a vertical hole, so that the top of the bolt was horizontal and thus formed the bench mark.

The numbers stamped on the bench marks described in the following pages represent the elevations to the nearest foot as determined by the levelman. These numbers are stamped with $\frac{3}{16}$ -inch steel dies on the tablets of post caps, to the left of the word "Feet." The office adjustment of the notes and the reduction to mean sea level datum may so change some of the figures that the original markings are 1 or 2 feet in error. It is assumed that engineers and others who have occasion to use the bench-mark elevations will apply to the Director of the United States Geological Survey, at Washington, D. C., for the adjusted values, and will use the markings as identification numbers only.

Datum.—All elevations determined by the United States Geological Survey and the United States Coast and Geodetic Survey are referred to mean sea level, which is the level that the sea would assume if the influence of winds and tides were eliminated. This level is not the elevation determined from the mean of the highest and the lowest tides, nor is it the half sum of the mean of all the high tides and the mean of all the low tides, which is called the half-tide level. Mean sea level is the average height of the water, all stages of the tide being considered. It is determined from hourly observations made by means of tidal gages placed at stations where local conditions, such as long, narrow bays, rivers, and like features, will not affect the height of the water. To obtain even approximately correct results these observations must extend over at least one lunar month, and if accuracy is desired they must extend over several years. At ocean stations the half-tide level and the mean sea level usually differ but little. It is assumed that there is no difference between the mean sea levels as determined from observations in the Atlantic Ocean, the Gulf of Mexico, and the Pacific Ocean.

The connection with tidal stations for bench marks in certain areas that lie at some distance from the seacoast is still uncertain, and this fact is indicated by the addition of a letter or word to the right of the word "Datum" on tablets or posts. For such areas corrections for published results will be made from time to time as the precise-level lines of the United States Geological Survey, the United States Coast and Geodetic Survey, or other Government organizations are extended.

Topographic maps.—Maps of the following quadrangles, wholly or partly in New York, have been published by the United States Geological Survey up to March 1, 1918. They may be obtained, unless

otherwise noted, at 10 cents each or \$3 for 50 on application to the Director of the Survey, at Washington, D. C.

PRECISE AND PRIMARY LEVELING.

ALBION QUADRANGLE.¹

[Latitude 43°-43° 15'; longitude 78°-78° 15'.]

Primary leveling in 1896 by E. L. McNair.

Bench marks tied to Canal bench marks.

Albion, Orleans House, corner of Platt and Bank streets, 40.5 feet from Bank Street corner, on Platt Street side, 7.7 feet from office door; bronze tablet stamped "521"-----	Feet. 519.984
Holley, Webster warehouse, south and west of Erie Canal bridge 115, in doorsill of door on canal side; copper bolt stamped "514"-----	513.210

Elevations determined from New York State survey levels, corrected.

Clarendon, 4 miles south of, opposite Andrew Kuhn's house on land belonging to Mrs. Butcher, 0.33 mile north of county line, in granite boulder; copper bolt stamped "648"-----	647.137
Elba, 3.8 miles northeast of, at southwest corner of junction of east and west road and road south to East Elba, in granite boulder; copper bolt stamped "675"-----	674.637
East Oakfield, 1.5 miles east of, 65 feet southeast of schoolhouse, district 9, 15 feet from road corner, on west side of north road, in boulder; copper bolt stamped "709"-----	708.143
South Barre, 220 feet east of road crossing, in stone doorsill of schoolhouse, district 9; copper bolt stamped "652"-----	651.645
Barre Center, 3 miles southwest of, 1.5 miles northeast of West Barre, E. E. Allis's house, on north side of road, in lower of three stone steps of eastern front door; copper bolt stamped "666"-----	665.304

Bench mark set from old railroad levels, corrected (value doubtful).

South Byron, 1,710 feet west of railroad station, 27 feet north from center of north track of New York Central & Hudson River R. R., in next to upper step of large culvert, across Black Creek; copper bolt stamped "682"-----	681.165
---	---------

ALEXANDRIA BAY QUADRANGLE.²

[Latitude 44° 15'-44° 30'; longitude 75° 45'-76°.]

Primary leveling in 1900 by William Kelley.

From Theresa north to Redwood, thence west to Alexandria Bay.

Redwood, the Dollinger House (hotel), east side and northeast corner of foundation wall; aluminum tablet stamped "365 Cape Vincent"-----	364.786
Alexandria Bay, Reformed church, 29.9 feet north-northeast from the northwest corner, in ledge in church lot; aluminum tablet stamped "283 Cape Vincent"-----	282.267

From Lafargeville north via Omar to Fishers Landing.

Omar, 420 feet northerly from intersection of Fishers Landing and Collins Landing roads, in bed rock on sandstone ledge, west side of the Collins Landing road, and on line with northerly side of the Omar schoolhouse, and distant 51.62 feet from northwest corner of schoolhouse; bronze tablet stamped "297 Cape Vincent"-----	295.745
---	---------

¹ See Bull. 514, pp. 95-96, for other elevations.² See Bull. 514, pp. 62-63, for other elevations.

Fishers Landing, crossroads near, 72.6 feet from the south corner of Mrs. Tom's residence and 131 feet northwest of the west corner of a house on the opposite side of the road; top of a round-headed $\frac{1}{4}$ -inch brass bolt ¹ cemented into bed rock 6 inches below surface of ground -----	Feet. 274.351
--	------------------

From Redwood north via South Hammond to Chippewa village.

Chippewa village, stone schoolhouse, district 11, 1 foot easterly from the northeast corner, set in bed rock; bronze tablet stamped "289 Cape Vincent" -----	287.768
Chippewa village, stone schoolhouse, district 11, north face of northeast corner; center-punch mark of a brass bolt (permanent bench mark C. V. of the Deep Waterways Commission) -----	290.698

AMSTERDAM QUADRANGLE.²

[Latitude 42° 45'–43°; longitude 74°–74° 15'.]

Precise leveling in 1898 by E. L. McNair.

From Duaneburg east along Delaware & Hudson R. R. to South Schenectady.

Duaneburg, 1,000 feet west of Delaware & Hudson station, north end of east abutment of bridge; bronze tablet stamped "681 A"-----	680.822
Duaneburg, in front of Delaware & Hudson station; top of south rail -----	676.6
Kelleys, at station; top of rail -----	490.9
Kelleys, 1.75 miles east of, 750 feet east of highway, at east abutment of cattle and wagon pass, in coping stone; bronze tablet stamped "410 A" -----	409.008
South Schenectady, at road crossing of West Shore and Delaware & Hudson railroads; top of rail -----	349.1

ANDES QUADRANGLE.

[Latitude 42°–42° 15'; longitude 74° 45'–75°.]

Leveling in 1915 by Karl E. Schlachter.

From Fraser southwest along New York, Ontario & Western Ry. to Hamden.

Fraser, in front of station; top of rail -----	1,323.6
Fraser station, 650 feet south of, in southwest abutment of railroad bridge over Platner Brook; bronze tablet stamped "N. Y. 1324"-----	1,323.631
Fraser station, 1 mile southwest of, 540 feet southwest of milepost N. Y. 192, in east side of concrete culvert 20; chiseled square painted "t. b. m. 1306.2" -----	1,306.24
Delancey, in front of station; top of rail -----	1,296.5
Delancey station, 270 feet south of, in east side of concrete culvert; bronze tablet stamped "N. Y. 1285" -----	1,285.497
Hamden, opposite store of E. L. Miller, top of hydrant painted "t. b. m. 1,288.3" -----	1,288.38
Hamden, in front of station; top of rail -----	1,282.1

¹ The letters "U. S. P. B. M. 29" are cut in the bedrock. This is a bench mark set by the Deep Waterways Commission.

TROY QUADRANGLE.¹

[Latitude 42° 30'–42° 45'; longitude 73° 30'–73° 45'.]

DATA CONCERNING THE GREENBUSH BENCH MARK AND THE ELEVATION OF HUDSON RIVER AT ALBANY.

The Greenbush bench mark, otherwise known as the "Gristmill" bench mark, was established by the Coast and Geodetic Survey in 1857. It is a cross cut in the face of the cellar wall of an old gristmill at Greenbush, opposite Albany, and has been an important reference mark of several Government and State surveys. The elevation of this bench mark is now accepted as 13.863

¹ See Bull. 514, pp. 48–50, for other elevations.

feet, as determined by precise leveling of the Coast and Geodetic Survey in 1902 from Dobbs Ferry and not changed by the 1907 or 1912 adjustment of precise leveling. Other elevations that have been determined for this bench mark at various times previously are given in the following table taken from the 1901 Report of the State Engineer:

TABLE No. 5.—*Elevations of the Greenbush bench mark.*

The elevation used for this bench mark by the U. S. Lake Survey in determination of the elevations of the Great Lakes, as published in Professional Papers No. 24, Corps of Engineers, United States Army, page 609, 1888, was 14.73 feet, which is also the value used for it by the Coast and Geodetic Survey between 1877 and 1900, by the Deep Waterway Survey in 1898-99, and by the Barge Canal Survey since 1900. The elevations given in the Report of the State Engineer for 1901 as "above mean tide New York," include this value for the Greenbush bench mark, therefore at Albany they are subject to a correction of minus 0.867 foot to accord with the 1912 adjustment value.

The elevation of Hudson River at Albany was determined from the lower miter sill of lock 1, which is reported to be a reliable reference mark. The height of mean low water above this point is given in the Report of the State Engineer for 1888, page 97, as 7.443 feet. The elevations in that report, as in the report for 1877, are based upon mean low water. The elevation of canal bench mark 4a, on lock 1, above the lower miter sill, was determined in 1901 as 23.855 feet (see elevations of these points, pages 657 and 709, Report of the State Engineer and Surveyor, 1901) and the accepted elevation of bench mark 4a, determined by precise leveling of the Lake Survey in 1902, as adjusted by the Coast and Geodetic Survey in 1903, is 16.824 feet. Mean half-tide range at Albany from Tide Tables, published by the Coast and Geodetic Survey, is 1.2 feet. Mean half-tide level at Albany is therefore $16.824 - 23.855 + 7.443 + 1.2 = 1.612$ feet above mean sea level.
